This Syllabus is brought to you for free and open access by the Course Syllabi at ScholarWorks. It has been accepted for inclusion in Syllabi by an authorized administrator of ScholarWorks. For more information, please contact scholarworks@mail.lib.umt.edu.
Instructor: Dr. Anna Sala; BOT 117-A; 243-6009; sala@mso.umt.edu
Days and Time: Tuesdays and Thursdays 2:10- 3:30 p.m.
Meeting Room: NAC 202
Office Hours: By appointment

Reference Texts: We will not follow a textbook. Instead, we will read papers from the literature. I will provide a list of general reference textbooks.

Reading Materials: Digital copies of selected papers will be distributed via email (you can also get them on your own)

Course Format: This is a combination of lectures/discussions course. It is not meant to be a comprehensive, content-filled ‘walk’ through the entire field of Plant Physiological Ecology. Instead, we will cover several broad topics centered on one or a few questions. For each topic I will provide some background and/or students will be assigned to read review papers ahead of time. Students will also read assigned ideas, synthesis or original research papers ahead of time, which will then be discussed in class. Most likely, we will not be able to cover all topics outlined. This is fine as long as you are aware of the issues not covered, and the relevance they may have on your work. Alternatively, we may modify topics depending on students’ interest. This means that this syllabus is only tentative and we may change it as we go. I will try to give updates of changes via email, but if you miss class it is ultimately your responsibility to make sure what has been covered and whether we made changes.

Pre-requisites: Plant Physiology is fundamental. If you are rusty, you should review the basics of water relations, photosynthesis, mineral nutrition and growth and development. Please, let me know if you need help to catch up with a particular topic.

What to expect: This is a graduate course that requires a graduate student attitude: you are here because you are interested and/or the topic is relevant to your graduate work, not because you are asked to. Therefore, I expect you to do your best. Undergraduate students taking this course should be aware that you are no longer in the passive, listener end. What you learn from this course ultimately depends on what you want to learn. Student participation and motivation is fundamental. Inquisitive and involved students result in interactive, fun and productive classes. Therefore, class success depends as much on your contribution as on mine. Read, read, read, and ask, ask, ask, particularly, if you do not know or you do not understand something. I benefit immensely from your feedback. I particularly welcome additional/different suggested readings, topics and questions, alternative interpretations or views, intellectual challenge (I benefit from your challenge as much as I will try to challenge you)

Grade Basis: Grades will be tentatively determined based on: 1) class preparation and participation, 2) synthesis/ outline/critique of selected papers, 3) performance on a take home final, and 4) proposal.

Tentative grading criteria: 320 points total
Synthesis/critique of discussion papers (10 papers @ 20 points each) 200
Take home final 60
Proposal 60

Synthesis/critique of selected papers: You are asked to write a short synthesis/critique of 10 of the papers discussed in class. Note that there are more papers discussed than written synthesis required. However, it is critical that you read each paper prior to class discussion regardless of whether you write a synthesis or not. I will not take more than one synthesis/critique per week (i.e. it comes to about one paper per week). Synthesis/critiques should be turned in prior to the discussion in class. Late papers will not be accepted. You are welcome to submit more than 10 syntheses, in which case I will use only the best 10 for grading purposes.

Each synthesis/critique should be typed, 12 font, adequate margins (no less than 1 inch), and no more than two pages long (1.5 line spacing is much preferred over single spaced but I will take both). I encourage you to follow a bulleted format as in the abstracts of many journals (e.g. New Phytologist; Functional Ecology, etc.). I tend to grade generously the first syntheses/critiques submitted, but I will tighten the grading gradually. The idea is for students to practice writing well, clearly, with a logical flow, and as succinctly as possible while not missing main points.

For original research papers, the first bullet should identify the broad conceptual/theoretical framework of the paper. Subsequent bullets should identify the specific topic of the paper, the questions/hypothesis pursued, the overall approach followed, main results and conclusions. A final bullet(s) should be your own critical evaluation of the paper (is the conceptual framework well defined?; are the hypotheses/main questions well justified and reasonable?; are the experiments and/or measurements appropriate to test the hypothesis/questions formulated?; are the methods and statistical analysis appropriate?; are the results clear and well presented?; are the results sufficient to test the hypothesis and draw the conclusions?; is the discussion sound?; what is the potential impact of the paper to the scientific community? etc.). If you think the research is well done and has no major flaws, you might not need to raise all of these points and your own creative comments and interpretation of the results will be just as valuable (or more!) for the discussion in class.

For review papers: Summarize in your own words the conceptual framework and the main ideas. I suggest writing a bulleted outline (as if you were preparing a talk about the material in the review) where each bullet conveys a clear message (e.g. broad conceptual background; purpose of the review; main approach; main findings; proposed directions, etc). You may want to highlight what you think are particularly relevant or innovative ideas. It may also be that you find the review problematic for whatever reason (e.g. certain topics not covered or not current enough, narrow focus, etc.). If so, add some bullets on why the review is problematic.

Take Home Final. It generally consists of evaluation/interpretation of real empirical data. I may also include some short essay-type questions, in which case I will specify whether you can consult your notes or not.

Proposals. The proposal should have a physiological component. Proposals are due on Tuesday of finals week. They should be typed, no more than 8 pages double-spaced (excluding literature and figures). See separate guidelines for proposal preparation. I will send examples of successful proposals or pre-proposals. Because the hardest part of a proposal is the Introduction (which is very important), we’ll go through a couple of rounds of Introduction drafts (the first due in October) before you submit your final proposal at the end of the semester.
**TENTATIVE CLASS SCHEDULE (See questions and readings below)**

At the end of the semester, I need at least 10 critiques selected from papers followed by ‘(critique)

<table>
<thead>
<tr>
<th>WEEK</th>
<th>DATE</th>

MAIN TOPICS AND TENTATIVE READINGS

Plant Groupings
- Why grouping?
- On what basis? Functional groups or Trait-based grouping? Why?

Reading:

Photosynthesis: responses to the environment
- How sensitive is photosynthesis to changes in light, water, temperature and CO₂?

Readings:

Photosynthetic pathways
- What were the drivers for the evolution of alternative photosynthetic pathways?
- Do we expect shifts between C₃ and C₄ species with climate change?

Readings:

Carbon Isotope Ratios
- What explains variation?

Reading:

Photosynthetic pathways and climate change
- Do we expect shifts between C₃ and C₄ species with climate change?

Reading:

Respiration
- How sensitive is respiration to light, temperature and moisture?
- Does respiration acclimate to changing temperature regimes?

Reading:

**Above and below ground carbon interactions**
- Does photosynthetic activity influence below ground processes?
- Measuring soil respiration: what in the world are we really measuring?

**Readings:**

**Carbon and growth**
- Does carbon availability control growth?

**Readings:**

**Phloem**
- How much do we know and why should we care?

**Readings:**

**Water Relations**
- Why does plant growth cease when water is limiting?
- Do plants face water transport efficiency vs. safety tradeoffs?
- What are the ecological implications of different drought resistance strategies?
- How does drought kill trees?

**Readings:**

Mineral nutrition
• What are the costs and benefits of different nutrient acquisition/conservation strategies in plants?
• What are potential effects of climate change on plant mineral nutrition?

Readings:

Plant Reproduction
• How costly is plant reproduction?

Reading:

Plant Secondary Compounds:
• How costly is plant defense?
• Do plants integrate defense responses?

Readings:
