STEP INTO THE GLAMOROUS ROMANTIC WORLD OF MODELING... AND LET ME BE YOUR GUIDE!
LEARNING GOALS AND OUTCOME

Computer modeling is possibly the most common means of studying ecological systems, because one can never measure all relevant functions of a complex system. The learning outcome I desire is for each student to achieve an ability to analyze any new ecosystem model they might encounter for stated purpose, key assumptions, structural organization and logic, critical limitations and limits of applicability. Secondly I want each student to be able to evaluate
whether their own research would be enhanced by modeling their ecosystem and where they might find a candidate model to start from.

NRSM 532 CLASS PROJECTS

CLASSWORK RESPONSIBILITIES (this is what your grade is based on)

1] DISCUSSION during class

2] First Model Summary Exercise.
   I will help each of you choose an ecosystem model relevant to your own studies, and guide you to where the model is published. You will prepare a brief summary of the model using the ppt template I provide to give in class on Feb 19. We will then, as a class, evaluate each of these models for their conceptual basis, appropriate uses, key assumptions, input requirements etc.

3] Detailed model analysis.
   Next, I want each of you to choose a different model from your first, and do a more detailed analysis. I want you to choose a well-documented and widely-used ecosystem model and evaluate it carefully. Summarize the stated objective and purpose of the model, key assumptions, the domain of interest in time and space, necessary inputs, model structure, connections, flowchart, the most important outputs, testing and validation and finally examples of uses that have been published. I expect this report to be 5-10 pages long, with appropriate graphics showing the model, validation, references, science done with the model etc.
   DUE: 7 April

4] Final project. To develop your own skills in systems analysis, I want each student to try a first conceptual layout of an ecosystem analysis problem of your choice, with objectives, assumptions, domain, logical flowchart, key cause-effect linkages and references. This class project will be the basis for our "final", as each student will present their project to the class verbally, and in written form to me.
   Remember from lecture 1 the general purposes of systems modeling:
   - to analyze the entire system holistically
   - to understand connections and causality
   - to organize field data
   - to prioritize future data collection
   - to generalize beyond the study site
   - investigate manipulations and perturbations
   - predict future system behavior
   And seven steps to model development we looked at:
   1. Define the question
   2. Bound the question – model objective
   3. Develop a conceptual model
   4. Determine the equations that define the process
   5. Computer implementation and parameterization
   6. Model testing and implementation
   7. Make conclusions
DUE: Finals week (May 12-16) for class presentations, and a written report.
Examples of Systems Ecology MODELS for NRSM 532/BIOS 534

Each of these models has a history of journal publications, validation, testing, open source code and documentation.

**Stand Level models**
- Biome-BGC – multi scale ecosystem biogeochemical cycles
  [http://www.ntsg.umt.edu/project/biome-bgc](http://www.ntsg.umt.edu/project/biome-bgc)
- FIRE BGC – a version of Biome-BGC that incorporates fire disturbance and successional processes
- FVS-BGC and TREE-BGC – forest inventory driven hybrid models
- Century and DAYCENT – a grassland biogeochemical cycling model
  [http://www.nrel.colostate.edu/projects/century/](http://www.nrel.colostate.edu/projects/century/)
- ED – a forest model of stand demographics
  [http://www.oeb.harvard.edu/faculty/moorcroft/data_sets/ed_2.1/](http://www.oeb.harvard.edu/faculty/moorcroft/data_sets/ed_2.1/)
- TEM – a terrestrial ecosystem model of biogeochemical dynamics
  [http://ecosystems.mbl.edu/tem/](http://ecosystems.mbl.edu/tem/)
- DLEM – dynamic land ecosystem model
  [https://fp.auburn.edu/sfws/esra/models/models_dlem.htm](https://fp.auburn.edu/sfws/esra/models/models_dlem.htm)
- StandCarb – forest carbon budget
  [http://andrewsforest.oregonstate.edu/pubs/webdocs/models/standcarb2/intro.htm](http://andrewsforest.oregonstate.edu/pubs/webdocs/models/standcarb2/intro.htm)

**Watershed - Regional level models**
- RHESSYS – a regional scale hydro-ecological simulation that routes streamflow
  [http://fiesta.bren.ucsb.edu/~rhessys/](http://fiesta.bren.ucsb.edu/~rhessys/)
- VIC – a hydrologic and water management model
  [http://www.hydro.washington.edu/Lettenmaier/Models/VIC/](http://www.hydro.washington.edu/Lettenmaier/Models/VIC/)
- HEC-RAS – watershed management model
- MOD 17 – satellite data driven calculation of terrestrial plant production
  [http://www.ntsg.umt.edu/project/mod17](http://www.ntsg.umt.edu/project/mod17)
- 3PGS – a simple satellite driven physiologically based model of forest growth
- Ecopath and Ecosim – aquatic ecosystem and fish management model
- CERES Wheat - Wheat crop growth and yield model
**Global models**

NCAR CLM – a land biophysical process model that works in a GCM
https://www2.cesm.ucar.edu/working-groups/lmwg

IBIS – Integrated Biosphere Simulator in a GCM
http://www.sage.wisc.edu/download/IBIS/ibis.html

Orchidee – a DGVM http://labex.ipsl.fr/orchidee/

LPJ – a dynamic global biome and vegetation model
http://www.nateko.lu.se/lpj-guess/education/

MC1 and MAPSS – ecosystem biogeography model from Oregon State

**Ecosystem service – socioeconomic models**

Invest – an ecosystem services model for water, carbon, and biodiversity
http://www.naturalcapitalproject.org/models/models.html

2052 – a global socio-economic model http://www.2052.info/

MAGICC – a global integrated assessment model
http://www.cgd.ucar.edu/cas/wigley/magicc/

IGSM - MIT IGSM Integrated Global Assessment Model
http://globalchange.mit.edu/research/IGSM

DICE – Dynamic Integrated Model of Climate and Economics, Nordhaus
http://www.econ.yale.edu/~nordhaus/homepage/dicemodules.htm

IMAGE Global integrated assessment model
http://themasites.pbl.nl/tridion/en/themasites/image/

FUND Climate Framework for Uncertainty, Negotiation and Distribution (FUND) is a so-called integrated assessment model of climate change.
http://www.fund-model.org/

**PAGE**

EPIC – agricultural crop model

There are many, many others, feel free to suggest one you are interested in.
