Are the moral traditions that were developed to guide human relations also relevant to interspecies relations? If so, to what extent are they relevant? If not, is it because the theories are ultimately anthropocentric, as some critics argue? Or are they problematic for other reasons? If our traditions fail to justify the interspecies obligations we have gut feelings about, then what other moral visions can we appeal to? And, importantly, how is environmental philosophy--all this pin-headish theorizing--relevant to our environmental crisis?

We begin by discussing some of the facts--the state of our water, air, soils, animals, wild places, and the poor who are most directly impacted by environmental pollution. Then we'll talk about what it means for our environmental crisis to be a *moral* crisis. By week three we'll be reading essays by theorists who attempt to extend traditional moral principles to guide our behavior toward nature. We'll also consider criticisms of these attempts. Deep ecologists, ecofeminists, and social ecologists try to articulate radically nontraditional ways of thinking about our moral relations to nature. We focus on that literature during the second half of the term.. The last three days or so of class feature group presentations of local environmental issues. Guidelines are forthcoming. Presentations include the groups' efforts to justify policy recommendations using class materials. This is when we test the theories against the "real world." We will also test theories against reality in field trips and in conversations with several guest speakers from environmental agencies in the community.
