Learning Outcomes

1. The first part of the course revisits concepts initially presented in CHMY 141-143 on atomic properties, in more depth, and with an update on changes and trends in the periodic table of the elements.
2. The second two weeks are devoted to oxidation and reduction and the students will learn the importance of this reaction type to environmental issues in the world today.
3. The remainder of the course presents material that that will be mostly new to the students. and will expect the students to connect the role of metals in industry, medicine and in biology.
4. The assessment approach will use weekly quizzes to keep the students aligned with the lecture material and the same points will be emphasized on the midterms and comprehensively on the final exam.
