# Do Young Children Treat a Robot as Having Intentions and Being Culpable For Its Actions?

Rachele Barker, Allie Beall, Caitlin Ryan, Shelby Rosston, Dennis Schuster, & Rachel L. Severson\*  
Department of Psychology

## Introduction

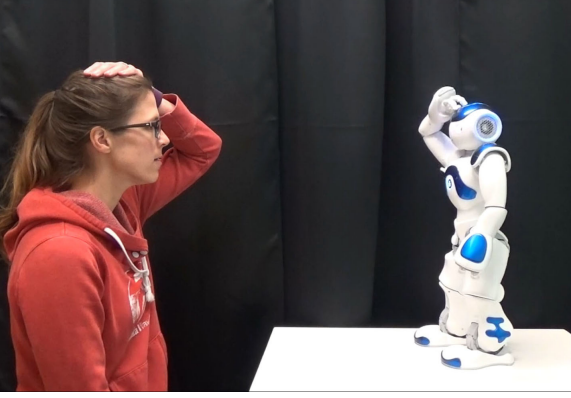

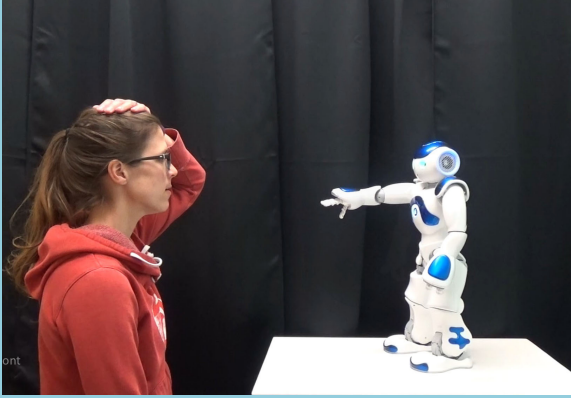

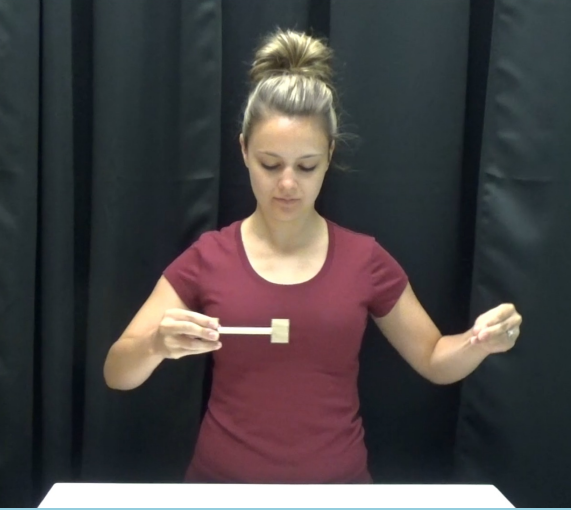

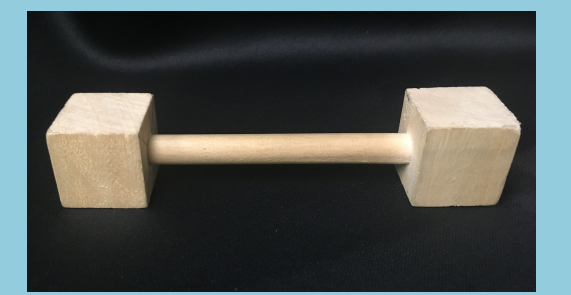

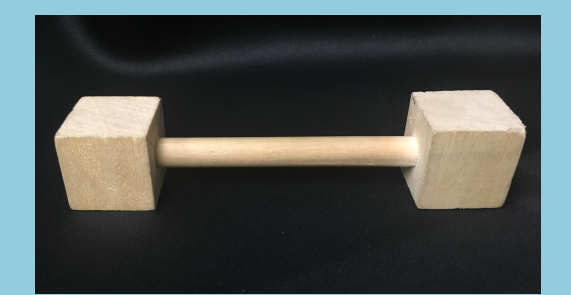

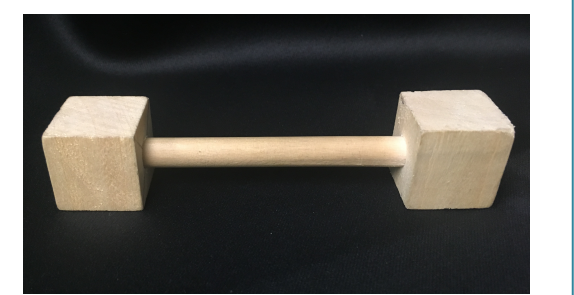

*Personified technologies*, such as smart speakers and social robots, are capable of projecting personas and mimicking human interactions<sup>1,2</sup>. Will children view personified technologies more like social others rather than just pieces of technology?

- Infants (18 months) view people, but not mechanical devices, as having intentions<sup>3</sup>.
- Infants (18 months) and children also treat robots as social others, but only when robots interact in a socially-contingent manner<sup>4,5</sup>.

The current study examines whether children will view a social robot as having intentions and, in turn, hold it morally responsible for its actions<sup>6-8</sup>.

## Method

- **Participants** ( $N=41$ ; target  $N=128$ ):  
**3 years** ( $n=22$ ;  $M=3.59$ ,  $SD=.27$ ) & **5 years** ( $n=19$ ;  $M=5.45$ ,  $SD=.31$ ); 51.2% girls
- **4 (condition) x 2 (age) Between-Subjects Design**

	Conditions			
	Human ( $n=12$ ; target $n=32$ )	Contingent Robot ( $n=10$ ; target $n=32$ )	Non-Contingent Robot ( $n=9$ ; target $n=32$ )	Control ( $n=9$ ; target $n=32$ )
<b>Contingency Manipulation</b>	X			X
<b>Dumbbell Task Model</b> "Intended-but-failed" Action				X
Does child pull apart dumbbell?				
<b>Tower Task</b> Person builds tower; model knocks down.				

**Ratings**  
(all conditions)

**Permissibility: Is it alright/not alright for the [person/robot] to knock over the tower?**

- (0) Not OK – a lot  
(1) Not OK – a little  
(2) OK – a little  
(3) OK – a lot

**Culpability: Should the [person/robot] get in trouble?**

- (0) No, not at all  
(1) Yes, a little bit  
(2) Yes, a medium amount  
(3) Yes, a lot

**Purposefulness: Did the [person/robot] do it on purpose or by accident?**

- (0) by accident  
(1) on purpose

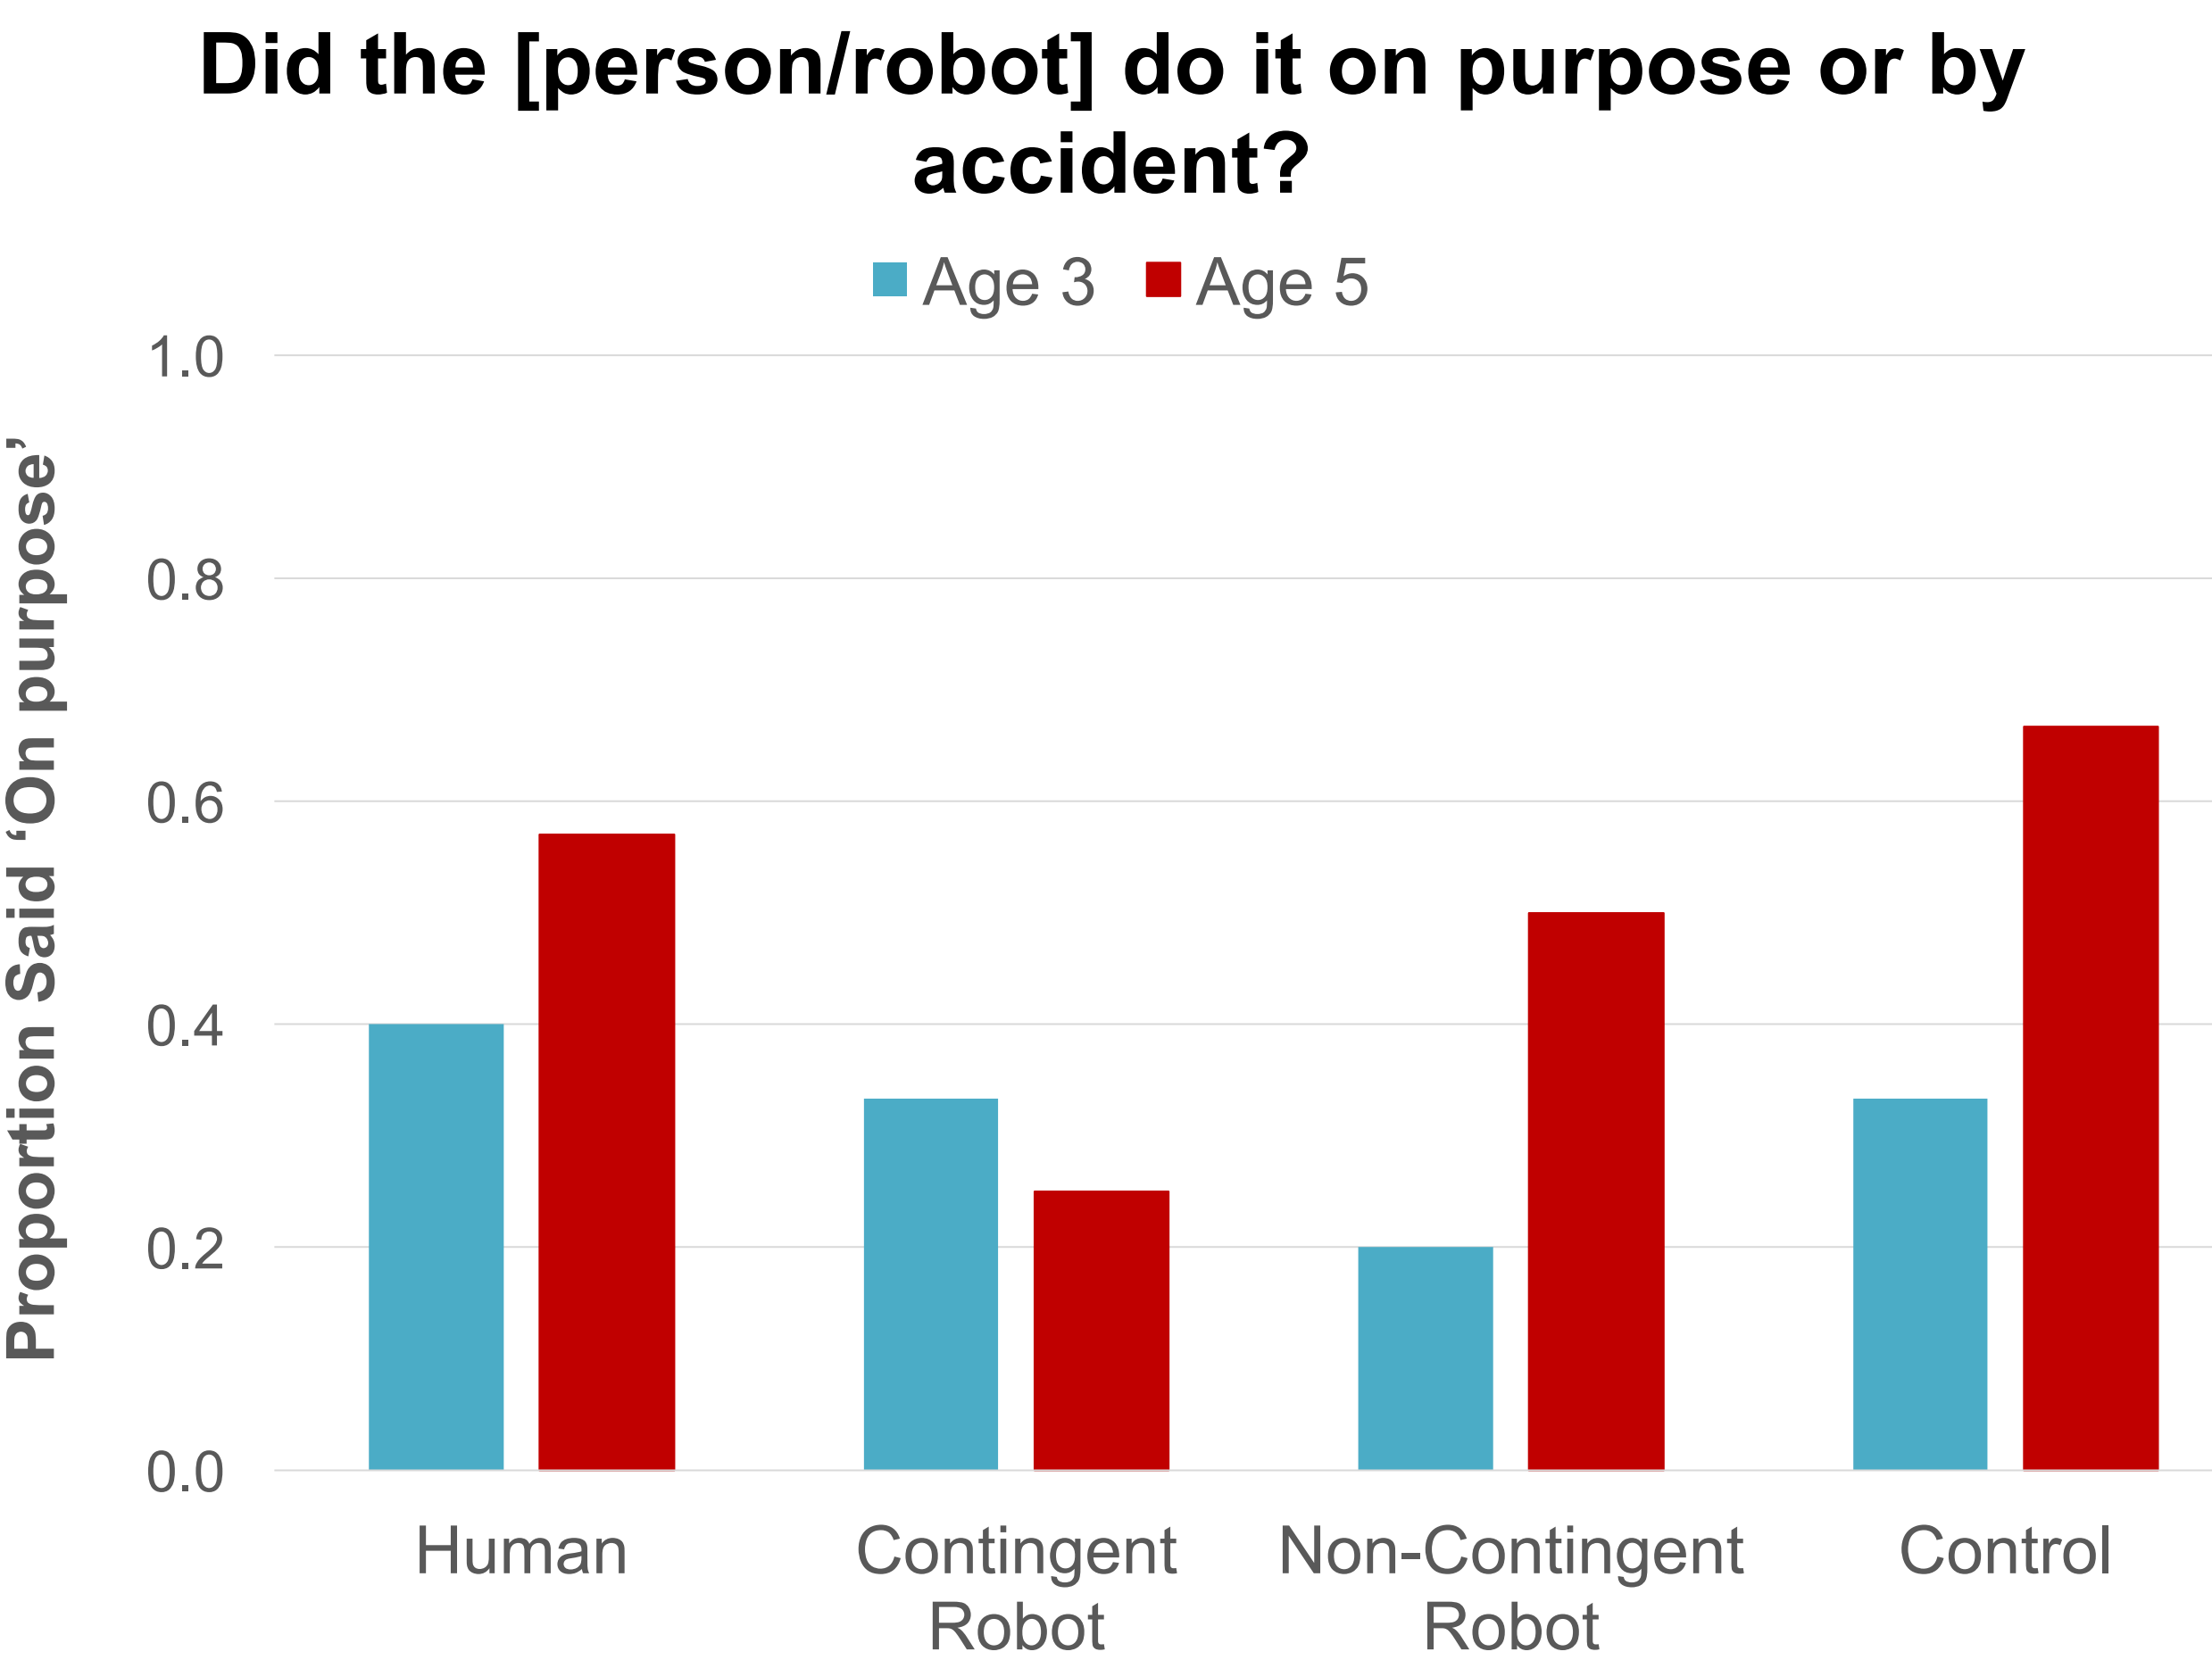

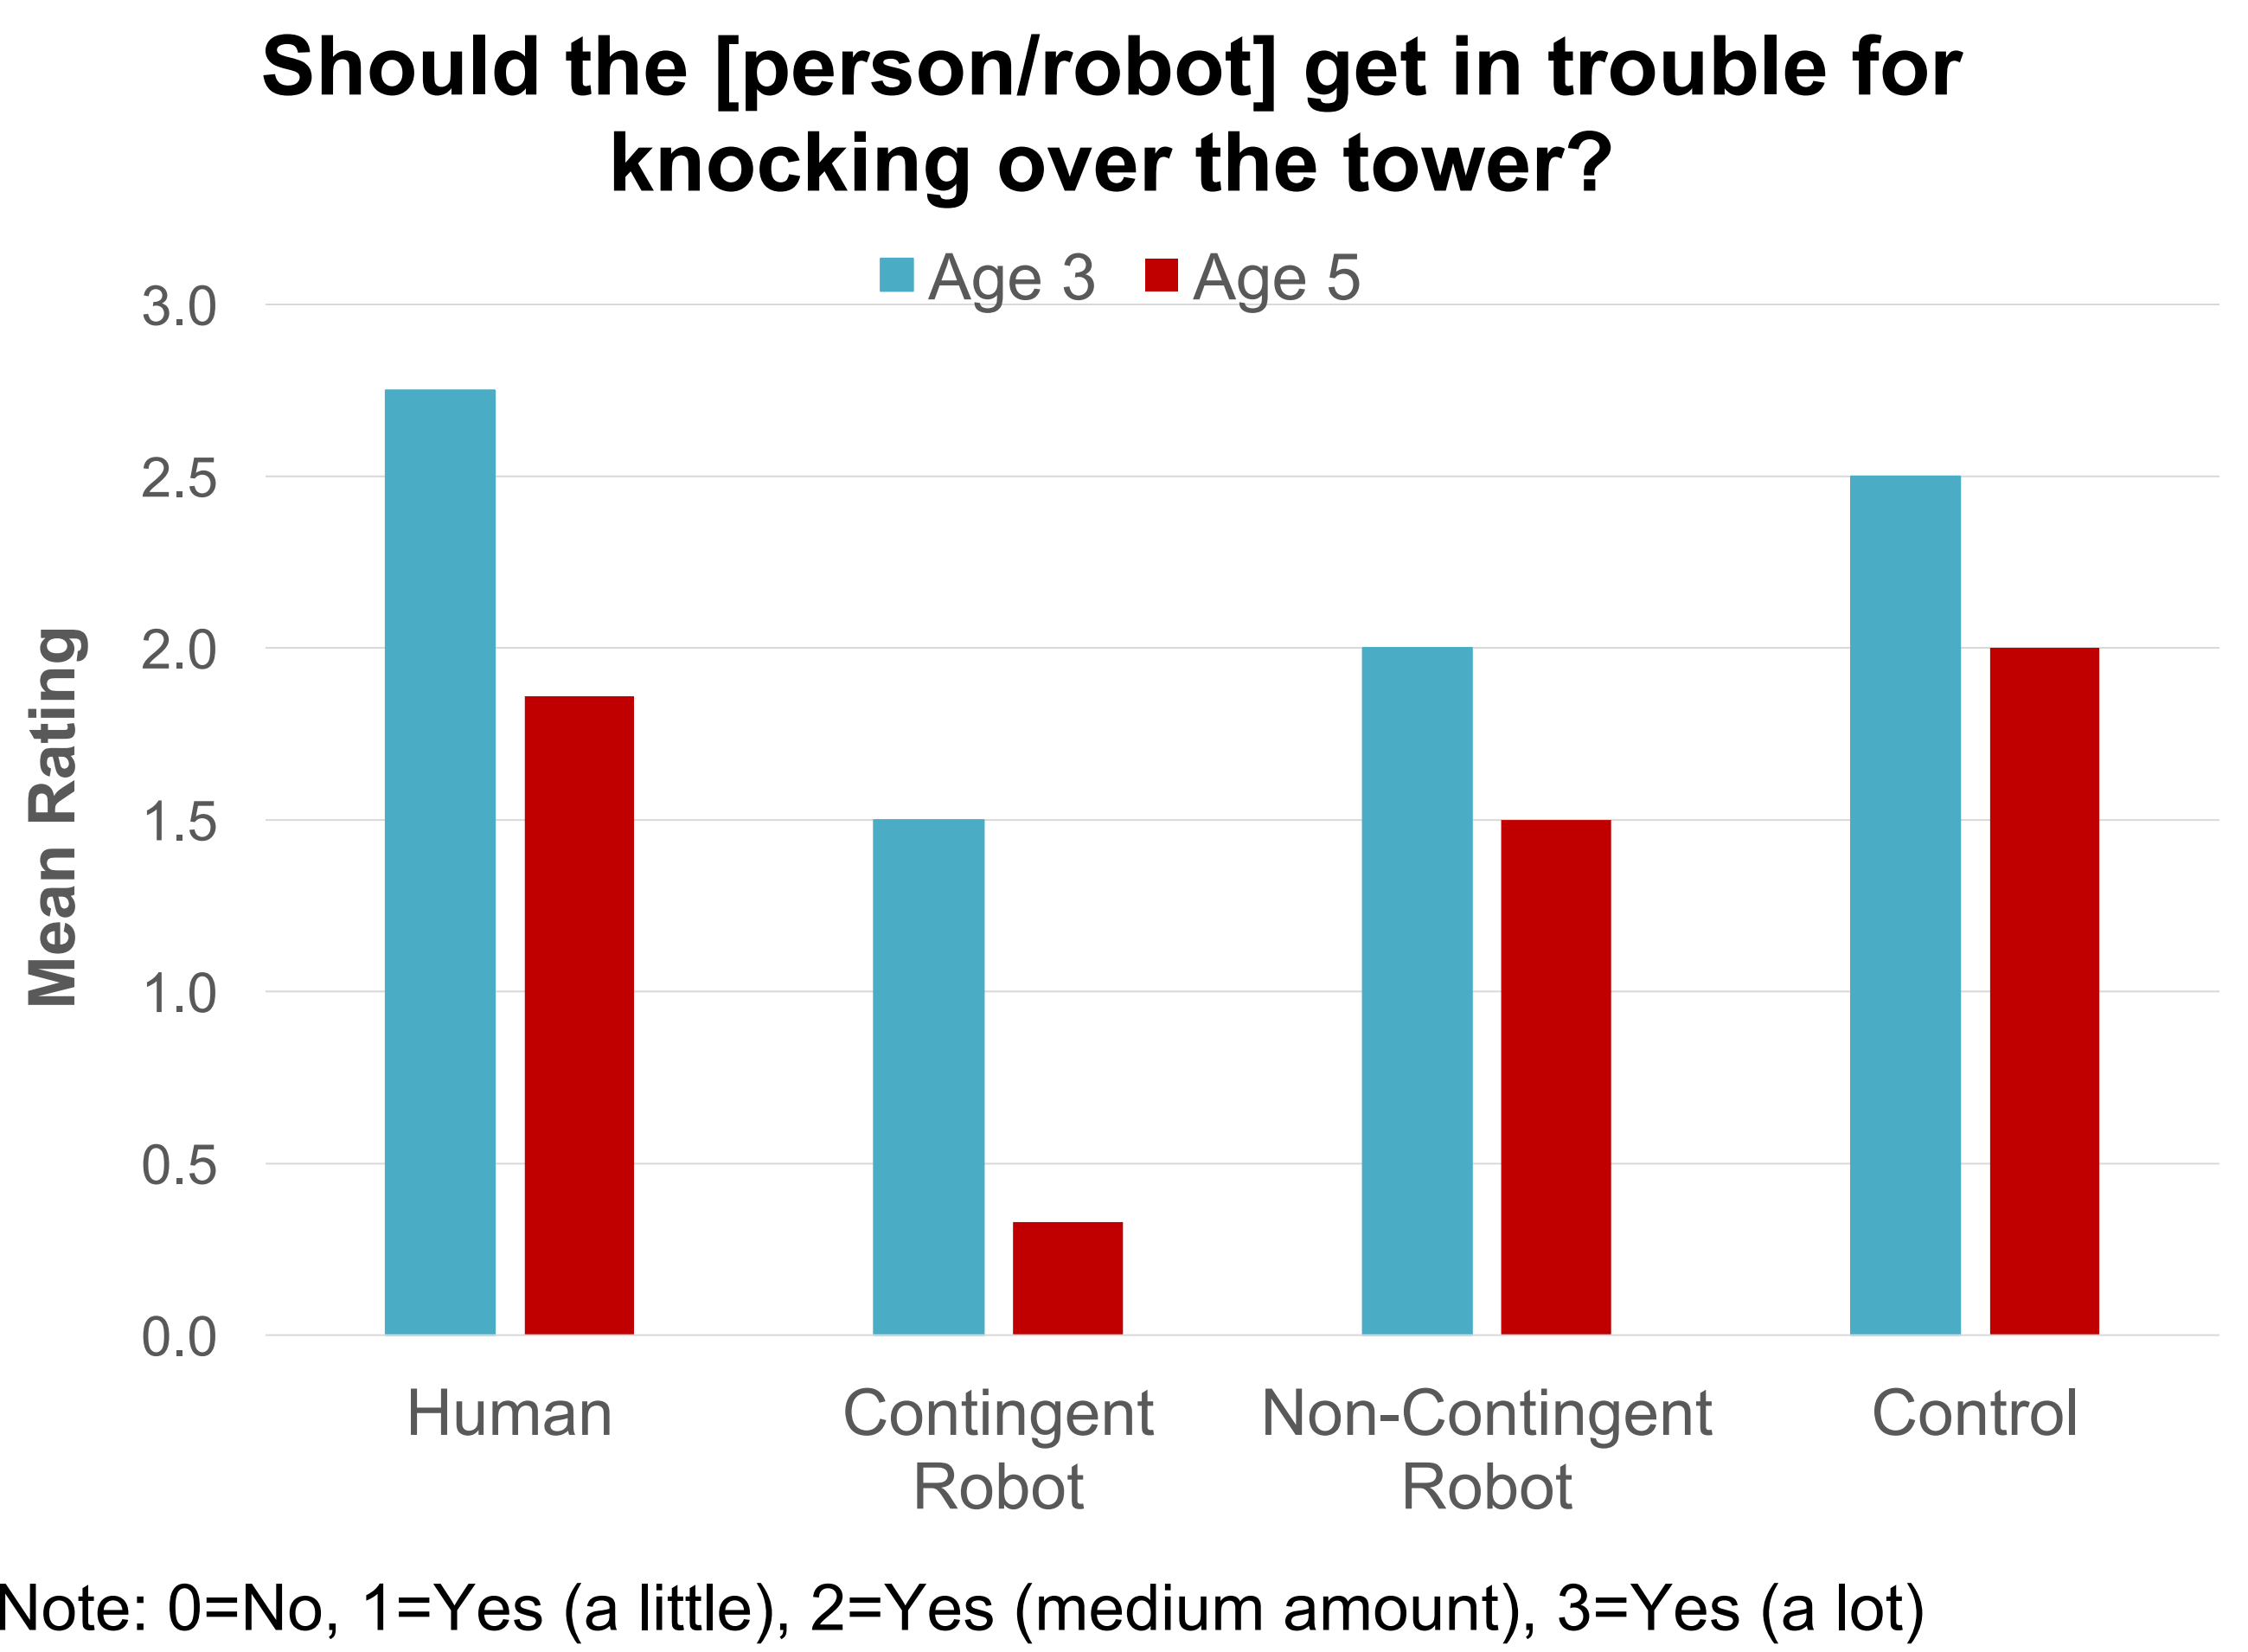

## Results: Dumbbell Task

**Dumbbell Task**  
Effect Sizes (Cohen's d)

	Human	Contingent Robot	Non-Contingent Robot	Control
<b>Human</b>	--	0.2388	0.2377	0.6719
<b>Contingent Robot</b>		--	0.4806	0.4151
<b>Non-Contingent Robot</b>			--	0.9429
<b>Control</b>				--

## Results: Tower Task

## Conclusions & Implications

The preliminary findings suggest children:

- Infer intentions to a robot to a similar degree as they do to humans (dumbbell task).
- View a robot's harmful actions as more permissible than a person's harmful actions (tower task permissibility).
- Hold a robot accountable for its actions, although descriptively to a lesser degree than humans (tower task culpability).
- Judge a robot's ambiguous actions as slightly less purposeful compared to a human (tower task purposeful).

These findings contribute to an emerging body of research on whether children conceive of personified robots as pieces of technology, as social others, or as somewhere in-between (e.g., New Ontological Category hypothesis<sup>1,2</sup>), and the moral consequences of doing so<sup>2,6-8</sup>.

**Acknowledgments.** This research was supported by a University of Montana UPG Small Grant (#325453) to R. S. We thank the Minds Lab research team and participating children for their contributions to this research.
