Abstract

Children across the nation experience significant academic and social-emotional problems. School psychologists are often the first line of defense in providing assessment, intervention, and consultative services to children and their families. School psychologists play an especially important role in providing services in communities where there are few mental health resources.

In addition, with the increasing cultural and linguistic diversity in public schools in the United States, school psychologists also have an important role to play in meeting the needs of children from diverse backgrounds (Oritz, 2008). School psychologist should make efforts to receive the training and experiences to further develop his or her cultural competence (NASP-Principles for Professional Ethics I.3.2). Cultural competence is the ability to effectively interact and provide culturally appropriate care to individuals from culturally and linguistically diverse backgrounds (Volberding, 2012). Cultural competence is composed of many factors. For instance, cultural competence entails being aware of own prejudices and biases toward others (e.g. student and their
families). Also, culturally competent school psychologists should learn traditions and nuances among diverse cultural groups and develop specific skills in assessment and intervention that are applicable with different groups (Sue, 2001; Sue, 2010).

Providing culturally competent services, therefore, is critical to ensuring that children are receiving appropriate services. School psychologists must become familiar and understand the culture of the community in which he or she is employed. Indeed, there are cultural differences between rural, urban, and suburban communities that a school psychologist should consider not just because of the differences in the physical environment, but because of the differences in social environments as well. For instance, urban environments are more likely to have large disparities in socioeconomic status and higher crime rates (Bureau of the Census, 2002), while the people of rural areas tend to have social networks that last for long durations and consist of norms of self-help and reciprocity (Phillips & McLeroy, 2004). Therefore, acknowledging such differences in sparse, moderate, or densely populated areas may inform training in cultural competency and better prepare school psychologists to provide appropriate
The purpose of this presentation is to examine school psychologists’ perceptions of their cultural competence to practice in their school and community. Specifically, this qualitative study will explore similarities and differences of cultural competence training and practice of rural, urban, and suburban school psychologist.

Method

Participants and Procedure. School psychologists (n = 231) who work in public schools in the Pacific Northwest and Rocky Mountain region of the United States were recruited to participate in this study. School psychologists self-identified as rural (n=94), urban (n=27) and suburban (n=87). Approximately 79% of participants surveyed are female and all participants received at least a Masters Degree in School Psychology or Education.

Measures. The online survey consisted of a demographic questionnaire as well as closed- and open-ended questions related to their current roles and responsibilities in their school and communities. For this study, specific open-ended questions will be utilized to examine culture competence training across the three groups. The selected questions are as follows: ‘Did you receive training in
cultural competence? ‘If yes, do you think you received adequate training in this area?’

**Data Analyses.** Responses to the two questions will be analyzed for themes across the three participant groups (i.e., rural, urban, and suburban). Passages of text will then be coded based on major themes across responses. This coding will determine: (a) Do school psychologists receive cultural competence training; (b) If so, was the training adequate; and (c) If not, how was a level of cultural competence achieved? Two researchers will code the data using Nvivo and determine inter-rater agreement.

**Implications**

This study will provide a better understanding of school psychologists’ cultural competence training and practice across cultural settings. Furthermore, identifying the unique challenges school psychologists encounter in each of these settings will inform and shape graduate training and professional development programs.
